

Appln. No. 10/707,711
Docket No. 140021 / GEM-0094

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

1. (currently amended) A magnetic field generator for producing a homogenous magnetic field region within a field of view, and being operable via electronics, the magnetic field generator comprising:
- a plurality of main magnet coils arranged in a cylindrical fashion;
 - a plurality of shielding coils arranged in a cylindrical fashion, and located radially outward of the plurality of magnets; and
 - electronics;
- wherein the main magnet coils and shielding coils are configured to shape a magnetic field which comprises at least one low fringe field region when in operation, the at least one low fringe field region being at a location less than 2.5 meters radially from the center of the field of view and having a magnetic field strength low enough so as to not harm the electronics; and
- wherein the electronics are located in the at least one low fringe field region when the magnetic field generator is in operation.

2. (original) The magnetic field generator of claim 1 further comprising negative coils to help shape magnetic field in the imaging volume.

3. (canceled)

Appl. No. 10/707,711
Docket No. 140021 / GEM-0094

4. (original) The magnetic field generator of claim 3, wherein the electronics may comprise:

- a gradient amplifier unit;
- an RF amplifier unit;
- a system controller; and
- a magnet monitor unit.

5. (original) The magnetic field generator of claim 3, further comprising:
a housing; and
wherein the electronics are located radially outward of the housing.

6. (original) The magnetic field generator of claim 1, wherein the at least one low fringe field region is less than about 50 gauss.

7. (original) The magnetic field generator of claim 1, wherein the at least one low fringe field region is less than about 10 gauss.

8. (original) The magnetic field generator of claim 1, wherein the at least one low fringe field region is less than about 2.5 gauss.

9. (original) The magnetic field generator of claim 5, wherein the at least one low fringe field region comprises a toroidal volume around the housing.

10. (original) The magnetic field generator of claim 5, wherein the electronics occupies a toroidal volume around the housing.

11. (original) The magnetic field generator of claim 1, wherein the magnets are superconducting coils.

Appl. No. 10/707,711
Docket No. 140021 / GBM-0094

12. (original) A magnetic resonance imaging system comprising:
a plurality of main magnet coils;
a plurality of shielding coils located radially outward from the plurality of main magnet coils;
a housing that houses the main magnet coils and the shielding coils;
electronics for operating the magnetic resonance imaging system, the electronics located radially outward of the housing and proximal to the housing; and
wherein the main magnet coils and shielding coils are configured such that they shape a magnetic field to comprise at least one low fringe field region when in operation.

13. (original) The magnetic resonance imaging system of claim 12, wherein the electronics are located in the low fringe field region when the magnetic resonance imaging system is in operation

14. (original) The magnetic resonance imaging system of claim 13, wherein the electronics comprise:

a gradient amplifier unit;
an RF amplifier;
a system controller; and
a magnet monitor.

15. (original) The magnetic resonance imaging system of claim 12, wherein the at least one low fringe field region is less than about 50 gauss.

16. (original) The magnetic resonance imaging system of claim 12, wherein the at least one low fringe field region is less than about 10 gauss.

17. (original) The magnetic resonance imaging system of claim 12, wherein the at least one low fringe field region is less than about 2.5 gauss.

Appn. No. 10/707,711
Docket No. 140021 / GEM-0094

18. (original) The magnetic resonance imaging system of claim 12, wherein at least one low fringe field region comprises a toroidal volume around the housing.

19. (original) The magnetic resonance imaging system of claim 12, wherein the electronics occupies a toroidal volume around the housing.

20. (original) The magnetic resonance imaging system of claim 12, wherein the magnets are superconducting coils.

21. (previously presented) A method for designing an MRI system that produces a low fringe field region, the MRI system operable via electronics, the method comprising:
defining a solution space;
defining a field of view, a center field and homogeneity requirements;
defining fringe field requirements such that the low fringe field region is produced at a distance less than 2.5 meters radially from the center of the field of view and has a magnetic field strength that is low enough so as to not harm the electronics; and
running an optimization algorithm to determine coil positions.

22. (original) The method of claim 21, further comprising:
determining whether the coil positions are feasible; and
determining whether an MRI system with the coil positions is manufacturable.

23. (previously presented) A storage medium encoded with machine-readable computer program code for designing an MRI system that produces a low fringe field region, the MRI system being operable via electronics, the storage medium including instructions for causing a computer to implement a method comprising:
defining a solution space;

Appln. No. 10/707,711
Docket No. 140021 / GEM-0094

defining a field of view, a center field and homogeneity requirements;
defining fringe field requirements such that the low fringe field region is produced at a distance less than 2.5 meters radially from the center of the field of view and has a magnetic field strength that is low enough so as to not harm the electronics; and
running an optimization algorithm to determine coil positions.

24. (previously presented) The magnetic resonance imaging system of claim 12, wherein:

the electronics are disposed within the at least one low fringe field region; and
the at least one low fringe field region has a magnetic field strength that is low enough so as to not harm the electronics.
